XBee radio module, ZigBee, chip antenna

USD \$32.00

Digi International's XBee modules are low-cost popular modules for wireless networking, and are offered in various configurations.

This module operates in the unlicensed 2.4GHz band, and is pre-configured with ZigBee firmware. It can be configured as either a Coordinator or a Router/End Node by using the free X-CTU utility from Digi International (click on Resources tab, above, for a link). *Note: this product operates at 3V. If you plan to use it in a 5V system, you will need to provide voltage-level translation for safe operation.*

We have created a number of handy adapters for use with this module, including USB-to-XBee, XBee-to-RS232, XBee-to-solderless breadboard, and a 4-channel 3V/5V level-shifter breakout board. Check them out in the [Breakout Boards](#) category, at the left.
